## Indicators of Environmental Quality

State of Hawai`i, Department of Health Environmental Health Administration January 2004

### **Table of Contents**

Document Notes	page 1
Air Indicators	
Ambient Levels of Sulfur Dioxide Compared to National Standards	2
Ambient Levels of Air-borne Particulates Compared to National Standards	3
Ambient Levels of Carbon Monoxide Compared to National Standards	4
Percentage of Schools in Compliance with Asbestos Management Plan Regulations	5
Land Indicators	
Contaminated Sites with Clean-up Completed	6
Cumulative Percentage of Leaking Underground Storage Tank Sites with Clean-up Partially Addressed or Completed	7
Quantity of Hazardous Waste Generated in Hawai`i	8
Percentage of Solid Waste Recycled in Hawai`i	9
Oil and Chemical Releases in Hawai`i	10
Water Indicators	
Percentage of Hawai`i's Population Served Drinking Water in Compliance with 1994 State and Federal Microbiological and Chemical Maximum Contaminants Levels	11
Cumulative Number of Sanitary Surveys Conducted for Drinking Water Systems in Hawai`i	12
Percentage of Underground Injection Wells in Compliance with State and Federal Reguations	13
Beach Closure/Warning Days Annually Due to Sewage or Water Pollution	14
Percentage of Wastewater Recycled Annually	15
Wastewater Treatment Plant Operation & Maintenance Compliance Records	16
Number of Impaired Streams Listed, 2002	17
Multi-Program Indicator	
Toxic Release Inventory for Hawai`i	18
Contact Information	19

#### **Document Notes**

Environmental Indicator: a tool that uses the best available data to measure the quality of the environment and/or progress made in protecting the environment.

This report includes a selection of seventeen environmental indicators, each occupying a single page. Each indicator shows a data set, a chart based on those data, and a discussion of the indicator and the data upon which it is based. Only data collected by, through or about the Hawaii State Department of Health programs are included.

The discussion accompanying each indicator is separated into five sections:

*Explanation:* the first section explains the data and chart, focusing on the fundamental picture portrayed the chart. Terms and caveats are also discussed in this section.

*Implications:* An "implications" section follows, with a short and sometimes subjective discussion of what impact the indicator findings may have on public health and the environment, and therefore on the Department of Health's (DOH) environmental programs.

Data Quality: The third section provides a one-word assessment of date quality for the indicator. Data quality is ranked as either High ( $\pm$  5-10% confidence), Medium ( $\pm$  10-25% confidence) or Low ( $\pm$  25-50% confidence).

The last two discussion sections note the *source of the data* and comment on *whether the data are required of DOH by the U.S. Environmental Protection Agency (EPA).* In most cases, when a percentage scale is used in a chart, the scale ranges from 0 to 100 percent. To more clearly show trends, some chart scales extend from values of 50% or 75% to 100%.

Data used are organized on a federal fiscal year (FFY) calendar unless otherwise noted, and usually cover the years 1998-2002 in order to show a five-year trend for each indicator. Some indicators do not have data available for that period, and some provide only a "snap shot" of information for a single year.

#### **Acronyms**

CAB -Clean Air Branch
CWB -Clean Water Branch
DOH -Department of Health

EHA -Environmental Health Administration
EPA -U. S. Environmental Protection Agency

EPO -Environmental Planning Office

NRIAQB -Noise, Radiation & Indoor Air Quality Branch

OSWM -Office of Solid Waste Management

SDWB -Safe Drinking Water Branch

SHWB -Solid & Hazardous Waste Branch

WWB -Wastewater Branch

DOH contact information is listed on page 19

# Ambient Levels of Sulfur Dioxide Compared to National Standards

Explanation: The national standard for sulfur dioxide ( $SO_2$ ) concentrations was set by EPA at 80 micrograms/cubic meter ( $\mu g/m^3$ ) as the annual average limit of  $SO_2$  in ambient air. The Honolulu air monitoring station is located atop the DOH building downtown. Data from this station are shown here as representative of  $SO_2$  concentrations in Hawai'i. The results show that the annual average over the past five years, 1-3  $\mu g/m^3$ , has been well below the standard.

Implications: Hawai'i's annual average  $SO_2$  concentrations are very low compared to the national standard. On persistent Kona wind days, volcanic emissions from the island of Hawai'i can be transported to Oahu and are experienced mostly as sulfates ( $SO_4$ ). These sulfates are included in the PM<sub>10</sub> (particulate) category expressed on the next page.

*Data Quality:* High (± 5-10%confidence).

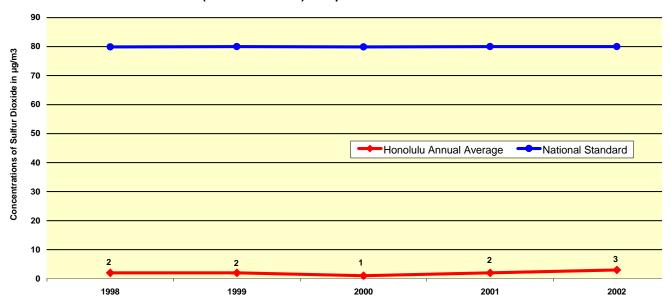

Source: DOH Clean Air Branch.

Data are required by the EPA.

#### Sulfur Dioxide Data

	Honolulu Annual	National Standard
FFY	Average of SO <sub>2</sub> (µg/m <sup>3</sup> )	for SO <sub>2</sub> (µg/m <sup>3</sup> )
1998	2	80
1999	2	80
2000	1	80
2001	2	80
2002	3	80

### Hawai'i's Annual Average Sulfur Dioxide Levels (Honolulu Station) Compared to the National Standard

# Ambient Levels of Air-borne Particulates Compared to National Standards

Explanation: The EPA has set the annual average of the particulate matter, or  $PM_{10}$ , at 50 micrograms/cubic meter ( $\mu g/m^3$ ).  $PM_{10}$  is defined as particulates with an aerodynamic diameter less than or equal to 10 microns. At the Honolulu monitoring station, located in the heart of downtown, the annual average concentration of particulates varied from 8 to 14  $\mu g/m^3$ . At 14  $ug/m^3$  this annual average is 72% below EPA's standard.

Implications: The concentrations measured in Honolulu are far below the national standard. The visual trend line shows that, within the past 5 years, the particulate levels dropped to a low of 9  $\mu$ g/m³ in 1998, rose to 16  $\mu$ g/m³ in 2001, then dropped to 15  $\mu$ g/m³ in 2002. PM<sub>10</sub> concentrations are not significantly affected by sulfates from volcanic emissions carried over O'ahu by Kona winds.

Data Quality: High (± 5-10%confidence).

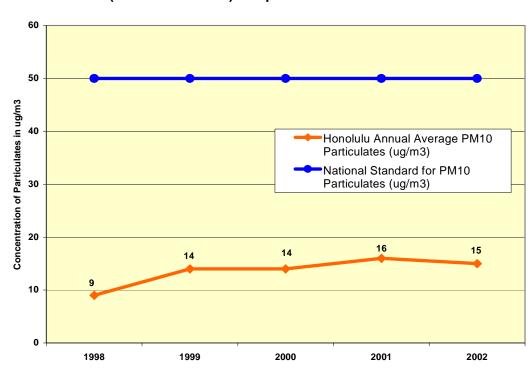

Source: DOH Clean Air Branch

Data are required by the EPA.

#### Air-borne Particulates Data

	Honolulu Annual	National Standard
FFY	Average of PM <sub>10</sub>	for PM <sub>10</sub>
1998	9	50
1999	14	50
2000	14	50
2001	16	50
2002	15	50

### Hawai'i's Annual Average Particulate Level (Honolulu Station)Compared to the National Standard

# Ambient Levels of Carbon Monoxide Compared to National Standards

*Explanation:* EPA set the 1-hour average limit for carbon monoxide (CO) concentrations in ambient air at 40,000  $\mu g/m^3$ . This indicator reflects CO data measured at the Honolulu monitoring station located in the heart of downtown, an area with heavy automobile traffic. The CO measurement differs from the other indicators in this report as it reflects a 1-hour average each year rather than an annual average. The maximum 1-hour average is obtained by calculating the arithmetic mean of the highest 1-hour value recorded daily. In addition to the 1-hour national standard, EPA has set an 8-hour standard for CO at 10,000  $\mu g/m^3$ . Hawai'i recorded 8-hour values are also well below the national standard.

*Implications:* CO has declined from the five-year high recorded in 1998. In 2002 the highest 1-hour average was  $3,990 \mu g/m^3$ .

Data Quality: High (± 5-10%confidence).

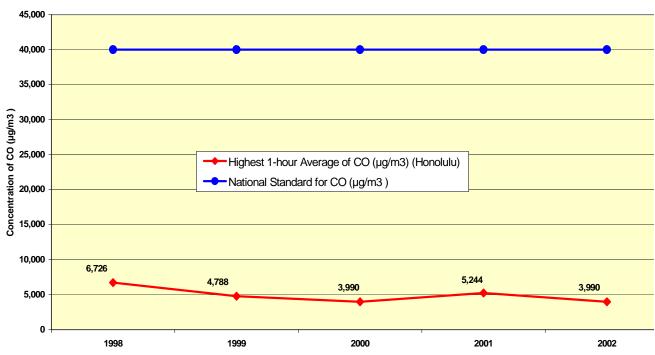

Carbon Monoxide Data

Source: DOH Clean Air Branch

Data are required by the EPA.

	Highest 1-hour Average	National Standard
FFY	of CO (μg/m³) (Honolulu)	for CO (µg/m³)
1998	6,726	40,000
1999	4,788	40,000
2000	3,990	40,000
2001	5,244	40,000
2002	3,990	40,000

## Hawai'i's Highest 1-hour Average for Carbon Monoxide (Honolulu Station) Compared to the National Standard

## Percentage of Schools in Compliance with Asbestos Managements Plan Regulations

Explanation: Buildings constructed before 1980 may contain asbestos in pipe insulation, structural fireproofing, mechanical areas, and wall plaster. If asbestos-containing building materials (ACBMs) are not properly identified and managed they may be unintentionally disturbed, causing the release of asbestos fibers. ACBMs still exist in Hawai'i's schools. EPA regulations and Hawaii Administrative Rules require each school to prepare an Asbestos Management Plan, which documents the presence and condition of ACBMs and specifies provisions for properly managing any ACBM present. Plans are required to contain inspection and re-inspection reports; periodic surveillance reports; response action information; notices sent to parents and employees; designated person information and custodian training documents. Since the program's inception in 1988, over 400 schools have been contacted by NRIAQB staff and informed of this requirement. For the purposes of this measurement, compliance is assumed unless an inspection proves otherwise. The number of schools required to comply will change as new schools open and existing schools are closed.

Implications: The chart shows a decline in compliance since the mid 1990s, likely the result of increased inspections revealing additional non-compliance. Nine out of ten schools have an asbestos management plan, but there is not necessarily a direct correlation between the existence of a plan and its implementation. However, in the past two years compliance improved, reflecting both an increase in the implementation of the plans in schools with ACBMs and additional compliance assistance activities provided by the program. The total number of schools required to comply increased due to the addition of Public and Charter Schools to the system across the state.

Data Quality: Medium (±10-25% confidence).

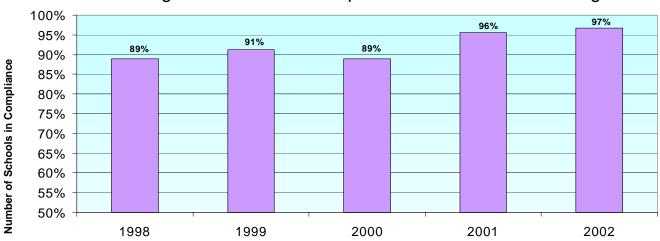

Source: Tom Lilekis (NRIAQB)

Data are required by the EPA.

### Percentage of Schools in Compliance with Asbestos Management Plan Regulations

<u> </u>					
	Total Number of Schools	Number of Schools in	Percentage of Schools in		
FFY	Required to Comply	Compliance	Compliance		
1998	389	345	89%		
1999	387	353	91%		
2000	412	368	89%		
2001	409	391	96%		
2002	416	402	97%		

#### Percentage of Schools in Compliance with Asbestos Management

### Contaminated Site with Clean-up Completed

*Explanation:* Progress made in the clean-up of contaminated sites, broken down into three categories, is measured by the date of completion of the clean-up process. The vast bulk of the clean-ups are comprised of leaking underground storage tank (LUST) sites. The next three indicators on the following pages will provide more specific data relating to the progress of each site category.

*Implications:* Staff has brought a backlog of LUST release cases into compliance with Hawai'i's UST rules. In addition, the number of new LUST sites has steadily decreased with only 30 new releases reported in 2003.

Data Quality: High (± 5-10%confidence).

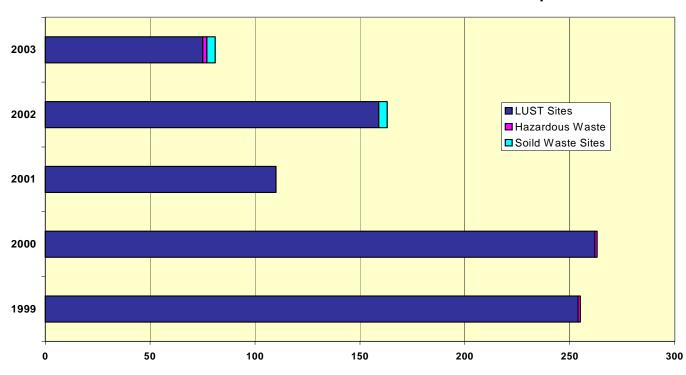

Sources: Grace Simmons (SHWB), Lane Otsu (SHWB), and Greg Olmsted (SHWB).

Data are required by the EPA.

Contaminated Sites Clean-up Data

	Hazardous	Soild Waste	LUST	
FFY	Waste	Sites	Sites	<b>Total Sites</b>
1999	1	0	254	255
2000	1	0	262	263
2001	0	0	110	110
2002	0	4	159	163
2003	2	4	75	81

#### Number of Contaminated Sites Cleaned-up

## Cumulative Percentage of Leaking Underground Storage Tank Sites with Clean-up Partially Addressed or Completed

Explanation: Of the 1,732 confirmed releases from underground storage tanks from 1987 to 2002, 80% have had 'clean-up' completed. Seventeen percent of the sites have had 'clean up' partially addressed, (i.e., efforts have begun which: manage contaminated soil, remove free product, manage dissolved petroleum, and/or monitor the groundwater or soil), and 3% have yet to be addressed.

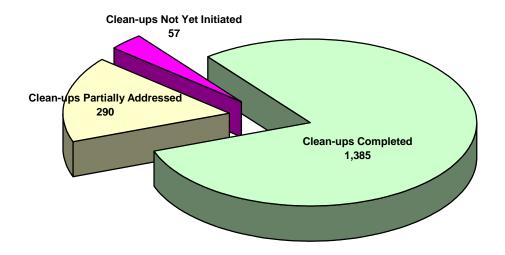

Implications: Some of the data for this indicator are included with data listed on the previous page; the data on this page pertains only to LUST sites and includes releases that have received no clean-up activity or that have only had clean-up partially addressed. Clean-ups for this category of contaminated sites has increased, while the number of new releases has decreased. Of the 3% of the sites that have not been addressed, some are recent releases for which the DOH has yet to receive information on clean-up efforts. None of the unaddressed sites constitutes an emergency situation.

Data quality: High (±5-10%confidence).

	LUST Site Clean-up Data						
Total Tanks	Active Tanks	Closed Tanks	Confirmed Releases	Clean-ups Partially Addressed	Clean-ups Not Initiated	Clean-ups Completed	
6,748	1,867	4,881	1,732	290	57	1,385	

Source: Greg Olmsted (SHWB). Data are required by the EPA.

## Status of Leaking Underground Storage Tank Sites Cleaned Up as of FY 2003

## Quantity of Hazardous Waste Generated in Hawaiii

Explanation: Hazardous waste generation, as presented in this indicator, is reported to EPA by "large quantity generators" biennially in odd years. "Small quantity generators" were included only in the 1995 data and, as a result, waste generation appears to peak in 1995. Overall, the quantity of waste generated, as shown in this indicator, has ranged from roughly 780 to 3,000 tons annually during the period from 1993 to 2001. Hazardous wastes in wastewater have been excluded from the indicator because the data quality for wastewater volumes is particularly questionable, especially since volume was removed as an EPA reporting requirement in 1997\*. The majority of hazardous wastes in Hawai`i are sent to permitted commercial treatment storage disposal facilities on the mainland, while the recyclable solvents are processed in state. Hazardous waste is defined in 40 CFR 261.3 as waste having any of the four hazardous characteristics: ignitability, corrosivity, reactivity, or toxicity, or a waste specially listed as a substance to be regulated as a hazardous waste. Common examples include paint, battery acid, oil, lead, and waste bleaches.

Implications: Compared to other states, hazardous waste generation has been relatively low in Hawai'i. During the ten-year period represented by this indicator, hazardous waste generation appears to be decreasing after a slight increase between 1993 and 1997. The significant decrease in waste generation for 2001 is linked to the efforts of the waste minimization coordinator and a stronger inspection and enforcement presence.

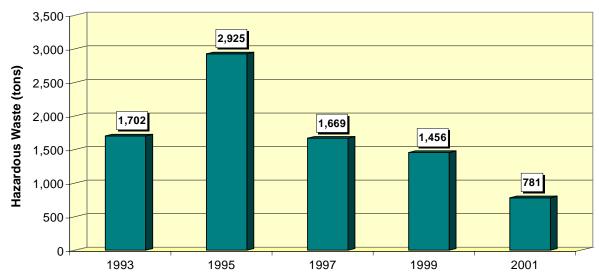

\* However, the amount on the EPA website for 2001 does include 464,076 tons of wastewater generated by Tesoro Refinery. In previous reports, Tesoro's wastewater generation was not included.

*Data Quality:* Low (± 25-50%) confidence. *Source:* Grace Simmons (SHWB).

Data are required by the EPA.

Hazardous Waste					
Ge	Generation Data				
	Hazardous Waste				
FFY	Generated in Tons				
1993	1,702				
1995	2,925				
1997	1,669				
<b>1999</b> 1,456					
2001	781				

#### Quantity of Hazardous Waste Generated in Hawai'i

### Percentage of Solid Waste Recycled in Hawai'i

Explanation: The percentage of solid waste diverted from landfills for recycling in Hawai'i is slowly increasing. In 2002, DOH did not receive diversion figures from some recycling facilities, as reporting is voluntary. As a result, we can only reflect partial data for this recycling indicator. The amount of solid waste produced each year has not risen significantly. A drop in the tonnages in the recyclables category perhaps reflects an overall decrease in waste generation. For the purposes of this indicator, tires and batteries are included in the 'other' category in the graph below. Amounts diverted do not include waste sent to H-Power for incineration and power generation.

*Implications:* Hawai'i's legislated goal was 50% solid waste recycling by the year 2000. We continue to fall short in accomplishing that goal. Hawai'i does not have a large local market for material, so most recycled goods must be shipped out for processing. These shipping costs make it difficult for Hawai'i recycling businesses to compete, especially in a period when the market price for raw recycled materials is low.

*Data Quality:* 2000-2002: Low (± 25-50%) confidence; 1997-1999: Medium (± 10-25%) confidence.

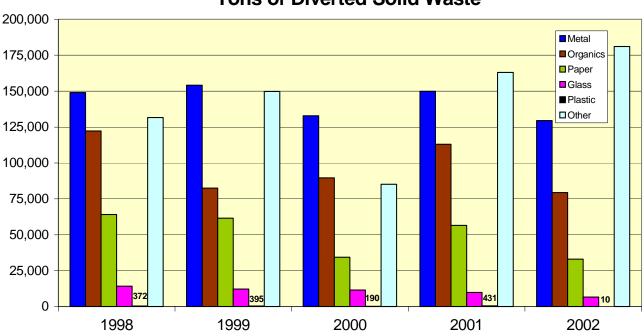

Source: Lane Otsu (SHWB)

Data are not required by the EPA.

#### Total Solid Waste Recycling Data (in tons)

	Produced	Disposed	Diverted	Percentage
FFY	Statewide	Statewide	Statewide	Diverted
1998	2,004,000	1,524,000	481,000	24.0%
1999	1,884,477	1,424,005	460,472	24.4%
2000	1,794,496	1,441,000	353,496	19.7%
2001	1,971,336	1,478,668	492,668	25.0%
2002	1,705,442	1,275,913	429,529	25.2%

#### **Tons of Diverted Solid Waste**

#### Oil and Chemical Releases in Hawaiii

*Explanation:* Any releases of oil or chemicals must be reported to DOH. No clear trend exists in the number of oil and chemical releases from 1998 to 2002. The database currently contains only initial information regarding a release. Follow-up information on releases (including volumes of releases) is not included.

Implications: Hazard Evaluation and Emergency Response office crews respond to roughly 400-500 'spills' each year. Most are minor, a few are major, and some are false alarms. An increase in the number of releases does not necessarily correlate with an increase in damage to the environment. Future tracking and reporting will include volumes of spills in addition to numbers of spills.

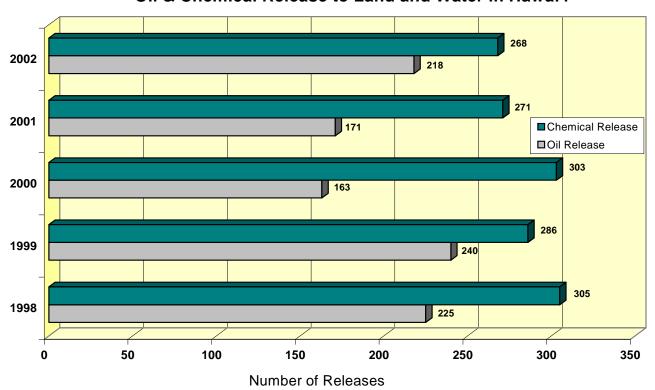

Data Quality: Medium (± 10-25%) confidence.

Source: Marsha Graf (HEER).

Data are not required by the EPA.

Oil &	Oil & Chemical Release Data			
FFY	Oil Releases	<b>Chemical Releases</b>		
1998	225	305		
1999	240	286		
2000	163	303		
2001	171	271		
2002	218	268		

## Percentage of Hawai'i's Population Served Drinking Water in Compliance with State and Federal Microbiological and Chemical Maximum Contaminant Levels

Explanation: In 2003, one hundred percent of Hawai'i's residents and visitors were served drinking water which met microbiological or chemical standards, called maximum contaminant levels (MCLs). Water that exceeds MCLs is believed to be harmful to human health. Population figures are derived by summing the populations each public system reports. The population served drinking water in exceedance of an MCL is counted for the entire year. In actuality, the exposure is usually for a few days or less.

Implications: The compliance rate has consistently exceeded 99% over the last 5 years, except in 2000 when it fell slightly below. In that year, microbiological violations in one medium-sized Big Island water system and one medium-sized Oʻahu water system decreased the population served water in compliance with MCLs. Whenever a violation is found, the public is notified through electronic media, hand-delivered notices, or published notices.

Data Quality: High (± 5-10%confidence).

Source: Ann Zane (SDWB)

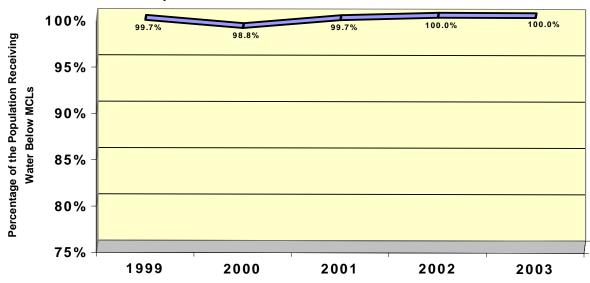

Data are required by the EPA.

**Drinking Water MCL Compliance Data** 

FFY	Total Population Served Drinking Water	Population Served Water Below MCLs	Percentage Population Served Water In compliance with MCLs
1999	1,294,772	1,291,099	99.7%
2000	1,291,907	1,277,016	98.8%
2001	1,289,360	1,285,821	99.7%
2002	1,300,251	1,300,251	100.0%
2003	1,300,715	1,300,682	100%*

\*Note: Although 33 persons in one water system were served water not in compliance with MCLs, the percentage still calculates to 100%.

## Percentage of Hawai`i's Population Served Drinking Water in Compliance with Maximum Contaminant Levels

Water

## Cumulative Number of Sanitary Surveys Conducted for Drinking Water Systems in Hawai'i, 2002-2006

*Explanation:* A sanitary survey consists of a periodic review of the water source, facilities, equipment, operation and maintenance practices and records to verify that a public water system is operating properly. The DOH goal is to conduct 'Sanitary Surveys' of all public water system source, treatment, and distribution operations in a five-year period. For Hawai`i, that averages 26 surveys per year. The SDWB completed the first five years by meeting its requirements, and is now beginning the next five-year cycle from 2002-2006. Because of personnel shortages, implementing new rules and regulations, and dealing with issues regarding national security of drinking water systems, meeting these survey goals will continue to be a challenge.

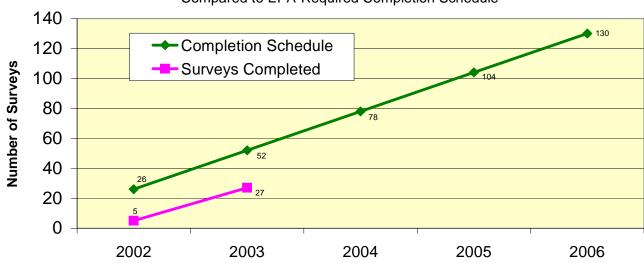

*Implications:* The last round of surveys was held from 1997 to 2001, so it is timely for DOH to inspect these water systems again. Within 30 days of each survey, the SDWB submits a sanitary survey report to the purveyor discussing any deficiencies and recommendations. The SDWB also requests a response from the purveyor within 30 days of receiving the report. When problems are found during surveys, the risk of water contamination is assessed. If the problem poses an imminent risk of contamination to the source or finished water, the SDWB will direct the purveyor to promptly correct the problem.

Data Quality: High (± 5-10%confidence).

Source: William Wong (SDWB).

	Total Number of	Surveys Completed
	Systems to Survey	Annually (Total from
	(Average of 26/Year)	2002)
2002	26	5
2003	52	22 (27)
2004	78	
2005	104	
2006	130	

Drinking Water Sanitary Surveys Completed Compared to EPA-Required Completion Schedule

# Percentage of Underground Injection Wells in Compliance with State and Federal Regulations

Explanation: The percentage of underground injection well facilities in compliance with state and federal regulations (those with a current permit) for the calendar year 2003 has increased about 2.5% to approximately 57% since the year 2002. Most noncompliant injection well facilities were those for drainage injection wells – wells used for rainfall runoff disposal. The compliance percentage for drainage injection well facilities was approximately 46%. Injection well facilities for sewage disposal and industrial-related wastewater disposal had a higher compliance percentage at approximately 85%. Permit renewals for sewage and industrial-related injection are processed before permit renewals for drainage injection.

*Implications:* Drainage injection wells pose a relatively low potential for environmental contamination, as compared to industrial or sewage related facilities. However, for counting purposes, all facilities are weighed equally.

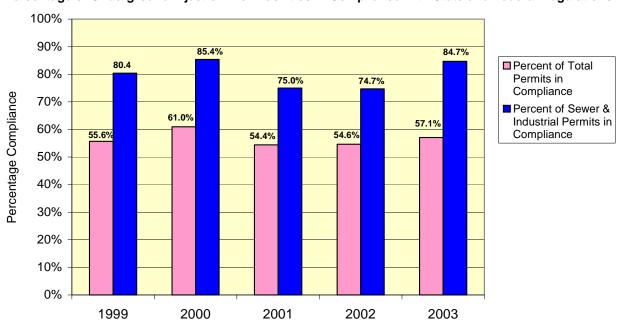

Data Quality: High (± 5-10% confidence).

Data are required by the EPA.

Source: Chauncey Hew (SDWB)

	Percentage of Underground Injection Wells in Compliance with State and Federal Regulations			
	Total UIC Permits	Total Expired	Percent of Total Permits	Percent of Sewer & Industrial
	Total OIC Permits	Permits	in Compliance	Permits in Compliance
1999	559	248	55.6%	80.4%
2000	574	224	61.0%	85.4%
2001	590	268	54.4%	75.0%
2002	617	280	54.6%	74.7%
2003	659	283	57.1%	84.7%

#### Percentage of Underground Injection Well Facilities in Compliance with State and Federal Regulations

# Beach Closure/Warning Days Annually Due to Sewage or Water Pollution

*Explanation:* Residents and visitors use our public beaches and the ocean for recreation and fishing. Sewage and chemical spills can restrict our enjoyment and use of the shoreline as well as affect aquatic life. The following table shows the number of times beaches were posted with warning or closure signs (unsafe due to water pollution) by the DOH, military, private and/or City & County of Honolulu.

*Implications:* There were no beach postings in 2003. For a sewage spill, the CWB reviews bacteria data prior to having the signs removed.

Data Quality: Medium (± 10-25%) confidence.

Source: Ann Teruya (CWB)
Data are not required by the EPA, but are reported in DOH's biennial 305(b) report.

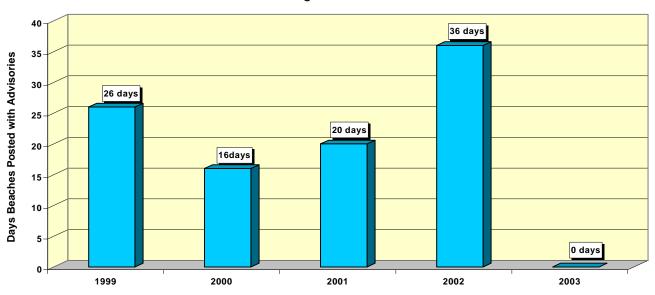

Beach Closure/Warning Days Annually Due to Pollution

Calendar	Days beaches
Year	closed per year
1999	26
2000	16
2001	20
2002	
2003	0

#### Notes:

i) There were additional posting of warning signs on streams, lakes, and harbors
 ii) Other agencies may also post warning signs on beaches. For example, the City and County of Honolulu also posts warning signs on beaches after opening stream mouths to drain water.

## **Beach Closures Days**Due to Sewage or Water Pollution

## Percentage of Wastewater Recycled Annually

Explanation: Wastewater recycling (or reuse of water treated to a level appropriate for irrigation purposes) has risen from roughly 17 million gallons per day in 1998 to nearly 24 million gallons per day in 2002, representing an increase of nearly 5% over the past five-year period.

*Implications:* DOH has plans to encourage reuse to about 25 mgd by 2005 and 30 mgd by 2015, or about 20%.

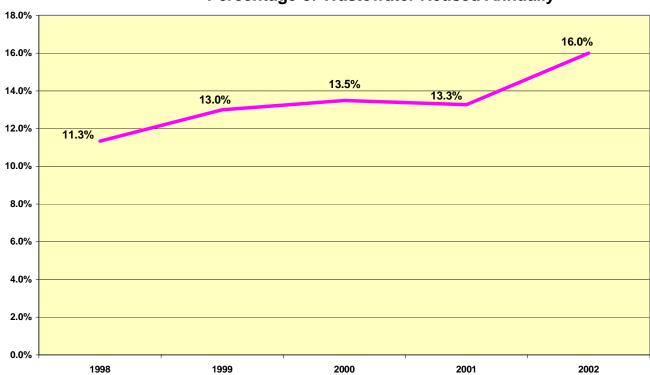

Data Quality: Medium (± 10-25%) confidence.

Source: Tomas See (WWB).

Data are not required by the EPA.

Wastewater Reuse Data			
	Total Wastewater	Wastewater	Percentage
FFY	Treated (MGD)	Reused (MGD)	Reused
1998	150.0	17.0	11.3%
1999	150.0	19.5	13.0%
2000	150.0	20.2	13.5%
2001	150.0	19.9	13.3%
2002	150.0	24.0	16.0%

#### **Percentage of Wastewater Reused Annually**

# Wastewater Treatment Plant Operations & Maintenance Compliance Records

Explanation: About three-fourths of Hawai'i's wastewater treatment plants show full compliance when inspected by the Wastewater Branch staff. Major operation and maintenance (O&M) deficiencies, effluent violations or permit violations warrant an unsatisfactory rating.

Implications: The stated goal of the WWB of 95% compliance by the year 2000 has not been achieved because of O&M deficiencies or effluent violations. The WWB staff believe operation and maintenance compliance leads to fewer sewage spills because well-maintained equipment breaks down less often. Another cause of the unsatisfactory ratings is underground injection permits (which are covered by the O&M inspection) that have expired (see page 13 for a discussion of the underground injection permit program).

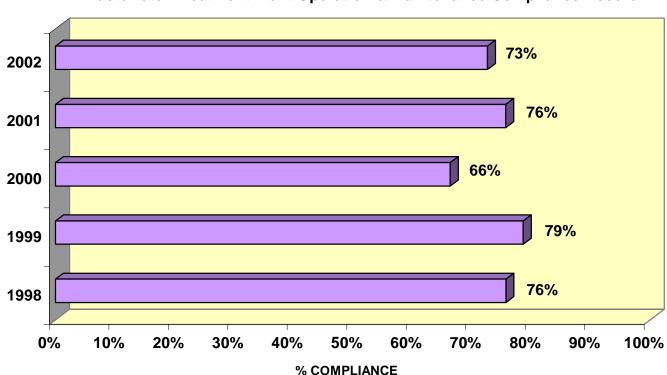

Data Quality: High (± 5-10% confidence).

Source: Marshall Lum (WWB)

Data are not required by the EPA.

	Number of Plants	Number of Plants	Percent in
FFY	Inspected	Rated Unsatisfactory	Compliance
1998	169	41	76%
1999	164	35	79%
2000	113	38	66%
2001	144	35	76%
2002	106	29	73%

#### **Wastewater Treatment Plant Operation & Maintenance Compliance Record**

### Number of Impaired Streams Listed, 2003

*Explanation:* This stream quality indicator is based on Hawaii's 2002 List of Impaired Waters. The List is composed of waters where readily available data indicated an exceedance of the water quality standards. The next List will be published in Spring of 2004.

Total Maximum Daily Loads (TMDLs) of pollutants must eventually be developed for all waterbodies on the Impaired Waters List. Currently, TMDLs have been established for the Ala Wai Canal, Waimanalo Stream and Kawa Stream. TMDL reports for Kaneohe, Waikele and Kapaa Streams will be public noticed in early 2004, pending the U.S. Environmental Protection Agency's approval of these reports. Additionally, DOH contractors are currently developing TMDL reports for streams draining into both Nawiliwili Bay and Pearl Harbor.

Implications: DOH is committed to addressing water quality issues from an ahupua'a perspective. This ancient Hawaiian concept embraces the watershed perspective and encompasses nearshore coastal waters, linking the mountains to the sea. This stream quality indicator, however, refers only to the inland part of a watershed with freshwater flows that usually have salinity lower than 0.5 parts per thousand (ppt), including all stream tributaries. The identification of these streams supports a process that identifies pollutant sources so that agencies, non-profits, businesses and community groups can begin to address these sources of pollution.

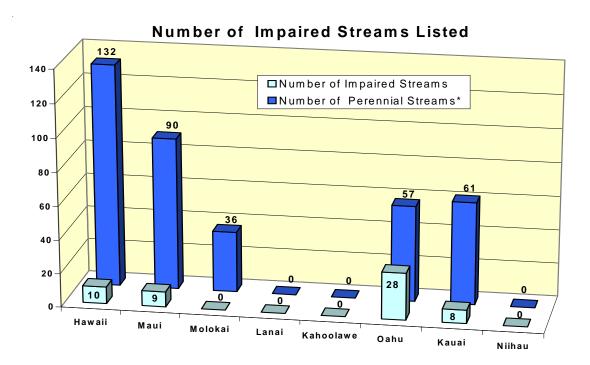

Data Quality: Medium (± 10-25%) confidence.

Source: Katina Henderson (EPO)

Data are required by EPA.

## Multi-Program

# Toxics Release Inventory 2001 Hawai'i Report

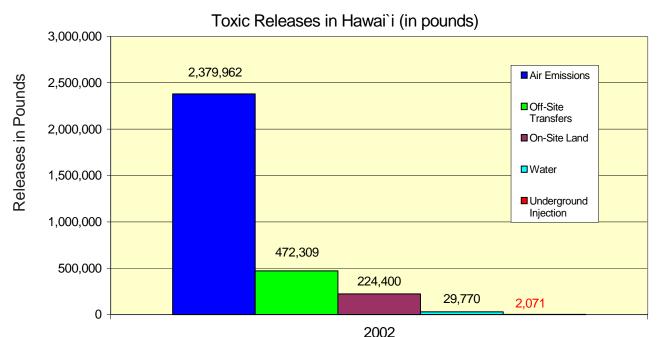

EPA's Toxics Release Inventory (TRI) program has released the 2001 data on toxics that are being released to the nation's air, water and land from major industry sectors throughout the United States.In Hawaii, 38 facilities reported 3.1 million pounds of toxic chemical releases\*. It is important to know that "release" should not be directly equated with "risk." To evaluate risk, release data must be combined with information about chemical toxicity, site-specific conditions, and exposure. In addition, these data do not indicate whether a facility is violating environmental laws.

The Hawaii 2001 TRI report reflected some major changes in reporting, and for this reason, we will start a new graph to show these differences. Some of the significant changes were the inclusion of "new industries" to the "original industries" category for air releases, as well as the use of different methods for calculating air emissions. The 2001 report also includes first-time reporting from four federal facilities. In past years, these federal facilities have engaged in similar activities that release chemicals to land, but did not report to TRI until 2001.

In 2000, the TRI was expanded to include additional persistent, bioaccumulative and toxic (PBT) chemicals, and required reporting for these chemicals at lower thresholds. PBT pollutants are toxic, persist in the environment and bioaccumulate in food chains, posing risks to human health and ecosystems. In 2001, lead and lead compounds were reported as PBT chemicals for the first time.

For more detailed information, refer to the EPA website at: www.epa.gov/region09/toxic/tri or www.epa.gov/tri/tridata/tri01/state/Hawaii.pdf

\*Release is defined as the amount of a toxic chemical released on-site (to air, water, underground injection, landfills and other land disposal), and the amount transferred off-site for disposal.

Data are not required of DOH by EPA, but EPA does require these data from private industries.
